# Arbeiten im BIM Explorer

You use BIM Explorer to perform the core tasks of handling projects by means of Bimplus. Primarily, you assess the current planning state of the project based on the coordination model consisting of various specialist models, define the issues to be done, and provide specialist planners with further information, which you attach to objects.

To do this, you can show and thus superimpose the specialist models in any combination, regardless of import type (directly from Allplan or by means of an IFC file or SketchUp file) and origin (Allplan or any other specialist planning tool).

If the superimposed models are not congruent, you can still move the models later.

**Topics in this chapter:**

Loading the building model into BIM Explorer

Controlling the view of the building model

Specifying what to display and how

Moving specialist models

Selecting a revision of a model

Finding objects by means of object navigator

Retrieving object characteristics and object properties

Adding further information to objects

Creating slideshows
